Notice
Use of the technologies described in this specification may infringe patents, copyrights or other intellectual property rights of FIPA Members and non-members. Nothing in this specification should be construed as granting permission to use any of the technologies described. Anyone planning to make use of technology covered by the intellectual property rights of others should first obtain permission from the holder(s) of the rights. FIPA strongly encourages anyone implementing any part of this specification to determine first whether part(s) sought to be implemented are covered by the intellectual property of others, and, if so, to obtain appropriate licences or other permission from the holder(s) of such intellectual property prior to implementation. This FIPA '97 Specification is subject to change without notice. Neither FIPA nor any of its Members accept any responsibility whatsoever for damages or liability, direct or consequential, which may result from the use of this specification.

51 Foreword

52 The Foundation for Intelligent Physical Agents (FIPA) is a non-profit association registered in Geneva, Switzerland. FIPA's
53 purpose is to promote the success of emerging agent-based applications, services and equipment. This goal is pursued by making
54 available in a timely manner, internationally agreed specifications that maximise interoperability across agent-based applications,
55 services and equipment. This is realised through the open international collaboration of member organisations, which are companies
56 and universities active in the agent field. FIPA intends to make the results of its activities available to all interested parties and to
57 contribute the results of its activities to appropriate formal standards bodies.

58 This specification has been developed through direct involvement of the FIPA membership. The 35 corporate members of FIPA
59 (October 1997) represent 12 countries from all over the world

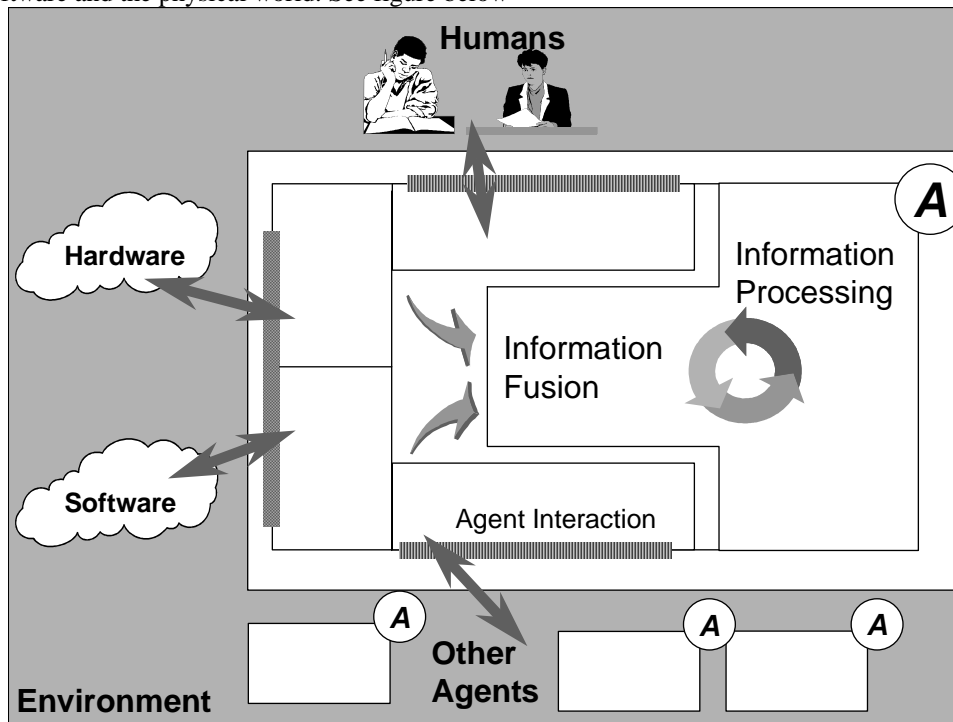

60 Membership in FIPA is open to any corporation and individual firm, partnership, governmental body or international organisation
61 without restriction. By joining FIPA each Member declares himself individually and collectively committed to open competition in
62 the development of agent-based applications, services and equipment. Associate Member status is usually chosen by those entities
63 who do want to be members of FIPA without using the right to influence the precise content of the specifications through voting.
64 The Members are not restricted in any way from designing, developing, marketing and/or procuring agent-based applications,
65 services and equipment. Members are not bound to implement or use specific agent-based standards, recommendations and FIPA
66 specifications by virtue of their participation in FIPA.

67 This specification is published as FIPA 97 ver. 1.0 after two previous versions have been subject to public comments following
68 disclosure on the WWW. It has undergone intense review by members as well non-members. FIPA is now starting a validation
69 phase by encouraging its members to carry out field trials that are based on this specification. During 1998 FIPA will publish FIPA
70 97 ver. 2.0 that will incorporate whatever adaptations will be deemed necessary to take into account the results of field trials.

71 **Introduction**

72 This FIPA 97 specification is the first output of the Foundation for Intelligent Physical Agents. It provides specification of basic
 73 agent technologies that can be integrated by agent systems developers to make complex systems with a high degree of
 74 interoperability.

75 FIPA specifies the interfaces of the different components in the environment with which an agent can interact, i.e. humans, other
 76 agents, non-agent software and the physical world. See figure below

77

78 **Figure 1 — Outline View of Agent Interaction**

79 FIPA produces two kinds of specification

80 **normative** specifications that mandate the external behaviour of an agent and ensure interoperability with other FIPA-
 81 specified subsystems;

82 **informative** specifications of applications for guidance to industry on the use of FIPA technologies.

83 The first set of specifications – called FIPA 97 – has seven parts:

84 three normative parts for basic agent technologies: agent management, agent communication language and agent/software
 85 integration

86 four informative application descriptions that provide examples of how the normative items can be applied: personal travel
 87 assistance, personal assistant, audio-visual entertainment and broadcasting and network management and provisioning.

88 Overall, the three FIPA 97 technologies allow:

89 the construction and management of an agent system composed of different agents, possibly built by different developers;
 90 agents to communicate and interact with each other to achieve individual or common goals;

91 legacy software or new non-agent software systems to be used by agents.

92 A brief illustration of the FIPA 97 specification is given below

93 **Part 1 Agent Management**

94 This part of FIPA 97 provides a normative framework within which FIPA compliant agents can exist, operate and be managed.

95 It defines an agent platform reference model containing such capabilities as white and yellow pages, message routing and life-cycle
 96 management. True to the FIPA approach, these capabilities are themselves intelligent agents using formally sound communicative
 97 acts based on special message sets. An appropriate ontology and content language allows agents to discover each other's
 98 capabilities.

99 **Part 2 Agent Communication Language**

100 The FIPA Agent Communication Language (ACL) is based on speech act theory: messages are actions, or *communicative acts*, as
 101 they are intended to perform some action by virtue of being sent. The specification consists of a set of message types and the
 102 description of their pragmatics, that is the effects on the mental attitudes of the sender and receiver agents. Every communicative
 103 act is described with both a narrative form and a formal semantics based on modal logic.

104 The specifications include guidance to users who are already familiar with KQML in order to facilitate migration to the FIPA ACL.
 105 The specification also provides the normative description of a set of high-level interaction protocols, including requesting an action,
 106 contract net and several kinds of auctions etc.

107 **Part 3 Agent/Software Integration**

108 This part applies to any other non-agentised software with which agents need to „connect“. Such software includes legacy software,
 109 conventional database systems, middleware for all manners of interaction including hardware drivers. Because in most significant
 110 applications, non-agentised software may dominate software agents, part 3 provides important normative statements. It suggests
 111 ways by which Agents may connect to software via „wrappers“ including specifications of the wrapper ontology and the software
 112 dynamic registration mechanism. For this purpose, an Agent Resource Broker (ARB) service is defined which allows advertisement
 113 of non-agent services in the agent domain and management of their use by other agents, such as negotiation of parameters (e.g. cost
 114 and priority), authentication and permission.

115 **Part 4 - Personal Travel Assistance**

116 The travel industry involves many components such as content providers, brokers, and personalization services, typically from
 117 many different companies. In applying agents to this industry, various implementations from various vendors must interoperate and
 118 dynamically discover each other as different services come and go. Agents operating on behalf of their users can provide assistance
 119 in the pre-trip planning phase, as well as during the on-trip execution phase. A system supporting these services is called a PTA
 120 (Personal Travel Agent).

121 In order to accomplish this assistance, the PTA interacts with the user and with other agents, representing the available travel
 122 services. The agent system is responsible for the configuration and delivery - at the right time, cost, Quality of Service, and
 123 appropriate security and privacy measures - of trip planning and guidance services. It provides examples of agent technologies for
 124 both the hard requirements of travel such as airline, hotel, and car arrangements as well as the soft added-value services according
 125 to personal profiles, e.g. interests in sports, theatre, or other attractions and events.

126 **Part 5 - Personal Assistant**

127 One central class of intelligent agents is that of a personal assistant (PA). It is a software agent that acts semi-autonomously for and
 128 on behalf of a user, modelling the interests of the user and providing services to the user or other people and PAs as and when
 129 required. These services include managing a user's diary, filtering and sorting e-mail, managing the user's activities, locating and
 130 delivering (multimedia) information, and planning entertainment and travel. It is like a secretary, it accomplishes routine support
 131 tasks to allow the user to concentrate on the real job, it is unobtrusive but ready when needed, rich in knowledge about user and
 132 work. Some of the services may be provided by other agents (e.g. the PTA) or systems, the Personal Assistant acts as an interface
 133 between the user and these systems.

134 In the FIPA'97 test application, a Personal Assistant offers the user a unified, intelligent interface to the management of his personal
 135 meeting schedule. The PA is capable of setting up meetings with several participants, possibly involving travel for some of them. In
 136 this way FIPA is opening up a road for adding interoperability and agent capabilities to the already established domain of Personal
 137 Information Management.

138 **Part 6 - Audio/Video Entertainment & Broadcasting**

139 An effective means of information filtering and retrieval, in particular for digital broadcasting networks, is of great importance
 140 because the selection and/or storage of one's favourite choice from plenty of programs on offer can be very impractical. The
 141 information should be provided in a customised manner, to better suit the user's personal preferences and the human interaction
 142 with the system should be as simple and intuitive as possible. Key functionalities such as profiling, filtering, retrieving, and
 143 interfacing can be made more effective and reliable by the use of agent technologies.

144 Overall, the application provides to the user an intelligent interface with new and improved functionalities for the negotiation,
 145 filtering, and retrieval of audio-visual information. This set of functionalities can be achieved by collaboration between a user agent
 146 and content/service provider agent.

147 **Part 7 - Network management & provisioning**

148 Across the world, numerous service providers emerge that combine service elements from different network providers in order to
 149 provide a single service to the end customer. The ultimate goal of all parties involved is to find the best deals available in terms of
 150 Quality of Service and cost. Intelligent Agent technology is promising in the sense that it will facilitate automatic negotiation of
 151 appropriate deals and configuration of services at different levels.

152 Part 7 of FIPA 1997 utilizes agent technology to provide dynamic Virtual Private Network (VPN) services where a user wants to
 153 set up a multi-media connection with several other users.

154 The service is delivered to the end customer using co-operating and negotiating specialized agents. Three types of agents are used
155 that represent the interests of the different parties involved:

156 The Personal Communications Agent (PCA) that represents the interests of the human users.

157 The Service Provider Agent (SPA) that represents the interests of the Service Provider.

158 The Network Provider Agent (NPA) that represents the interests of the Network Provider.

159 The service is established by the initiating user who requests the service from its PCA. The PCA negotiates in with available SPAs
160 to obtain the best deal available. The SPA will in turn negotiate with the NPAs to obtain the optimal solution and to configure the
161 service at network level. Both SPA and NPA communicate with underlying service- and network management systems to configure
162 the underlying networks for the service.

163 One central class of intelligent agents is that of a personal assistant (PA). A personal assistant is a software agent that acts semi-
164 autonomously for and on behalf of a user, modelling the interests of the user and providing services to the user or other people and
165 PAs as and when required. These services include managing a user's diary, filtering and sorting e-mail, managing the user's
166 activities, locating and delivering (multimedia) information, and planning entertainment and travel. Some of the services may be
167 provided by other agents or systems, the Personal Assistant acts as an interface between the user and these systems.

168 In the FIPA'97 test application, a Personal Assistant offers the user a unified, intelligent interface to the management of his personal
169 meeting schedule. The PA is capable of setting up meetings with several participants, possibly involving travel for some of them.

170 This turns the PA into a multi-agent application, because the services of the PAs of these other users as well as of the Personal
171 Travel Assistant system will be needed.

172 The design of the PA application is based on a set of scenarios that represent an increasing level of co-operation needed between
173 the PAs of the users involved. In the simplest scenario, the initiator of the meeting specifies time and place, to which other users
174 (PA's) can conform or not. A more flexible scenario, however, involves negotiation about time, place, and possibly other aspects of
175 the proposed meeting (such as attendance).

176 These scenarios exercise the Agent Communication Language, as well as the Interaction Protocols adopted by FIPA. Also
177 Directory Facilitators, Agent Name Servers, inter-domain address resolution, and possibly one or more Agent Request Brokers to
178 interface with non-FIPA compliant software are used. The PA application uses at least one other FIPA test application, viz. the
179 Personal Travel Assistant.

180 1 Scope

181 This part of the FIPA 97 specification defines one of the four test applications that serves as an initial test of the technology-
182 oriented normative parts of the FIPA 97 specification (Parts 1,2, and 3).

183 2 Conformance

184 Methodologies for conformance of an implementation to this specification will be published in a later document.

185 3 Normative reference(s)

192 versit:1996, *vCalendar – The Electronic Calendar and Scheduling Exchange Format, Version 1.0*, (maintained by the Internet Mail
193 Consortium)

194 4 Term(s) and definition(s)

195 User

196 The human user of a *personal assistant*. Usually, there is one personal assistant to a user.

197 User Interface Agent

198 A software agent which translates services from a user interface (e.g. graphical or speech-based) into ACL.

199 Personal Assistant (PA)

200 A software agent dedicated to and acting on behalf of a *user*. There is usually one user to a personal assistant.

201 Personal Travel Assistant (PTA)

202 A software system providing assistance in planning and execution of trips.

203 Travel Broker Agent (TBA)

204 A software agent acting as the front-end to the PTA system, which handles travel queries.

205 vCalendar

206 The generic term for an electronic, virtual collection of calendaring and scheduling information that can be
207 transferred between computers, PDAs, or other electronic devices through telephone lines, or e-mail
208 networks, or infrared links. How, when, why, and where vCalendar are used depends on the applications
209 developed utilising a vCalendar.

210 5 Symbols (and abbreviated terms)

211 PA: *Personal Assistant*

212 PTA: *Personal Travel Assistance*

213 API: *Application Programming Interface*

214 UTC: *Universal Time Coordinated; also known as UCT, for Universal Coordinated Time*

215 6 Overview of the Personal Assistant Domain

216 6.1 Introduction

217 One central class of intelligent agents is that of a personal assistant (PA). A personal assistant is a software
218 agent that acts semi-autonomously for and on behalf of a user, modelling the interest of the user and
219 providing services to the user or other people/PAs as and when required.

220 A personal assistant is like a secretary, it accomplishes routine support tasks to allow the user to concentrate
 221 on the real job, it is unobtrusive but ready when needed, rich in knowledge about user and work.

222 The notion of a personal assistant is very open-ended. There are many internal and external functions and
 223 services that can and will be used to provide and extend a Personal Assistant's basic functionalities. In fact,
 224 such openness to new services is a critical requirement where interoperability of PA's functions/services is
 225 desirable. The use of agent technology to support the Personal Assistant helps in achieving this requirement.

226 Examples of such functions/services include:

- 227 managing a user's diaries (e.g., meeting scheduling)
- 228 filtering and sorting mails (e.g., electronic mails)
- 229 managing a user's desktop environment (e.g., file system)
- 230 managing a user's activities, plans and tasks (e.g., workflow)
- 231 locating and delivering (multimedia) information
- 232 recommending entertainment (e.g. movies, restaurants, theatres)
- 233 purchasing desired items
- 234 planning travel, etc.

235 Whereas this specification focuses on the generic requirements for the personal assistant application, other
 236 FIPA application scenarios - especially Personal Travel Assistance (PTA) and Audio-Visual Entertainment
 237 and Broadcasting - also include the notion of personal assistance for specific applications.

238 In particular, the PTA service is different from the Personal Assistant service in the following sense. PTA is
 239 an integrated system which spans a particular market segment of the electronic marketplace. On the other
 240 hand, the PA provides a user-oriented front-end to a wide variety of different services, one of which may be
 241 the PTA travel service.

242 In this section, we first describe the general model of the Personal Assistant domain as adopted by FIPA, then
 243 introduce the particular application, that of scheduling meetings, chosen for the FIPA'97 Personal Assistant
 244 application. The next section will provide the detailed specification of the application. A field trial will verify
 245 the applicability and feasibility of the specification with regard to the Personal Assistant domain; the details
 246 and underlying assumptions of the PA field trial are provisionally described in [FIPA Document fipa7607].

247 **6.2 Personal Assistant Reference Model**

248 In general, a personal assistant comprises:

- 249 Intelligence and associated capabilities such as rationality (reasoning and planning) and
 250 adaptability/learning.
- 251 Knowledge including facts, rules and adapted/learned knowledge for and about an end-user.
- 252 Interaction capabilities and facilities with the user, other agents and software/hardware
 253 services/functions.
- 254 The services/functions and their procedures for the agent to work with them.

255 The scope of this composite is limited to the tasks which are given by the user as goals and preferences for
 256 behaviour. Other agents will also exist and interact with the personal assistant, but such other agents will not
 257 tend to represent particular user's preferences, or access authority and other differentiators. The composite is
 258 visualised in the following reference model.

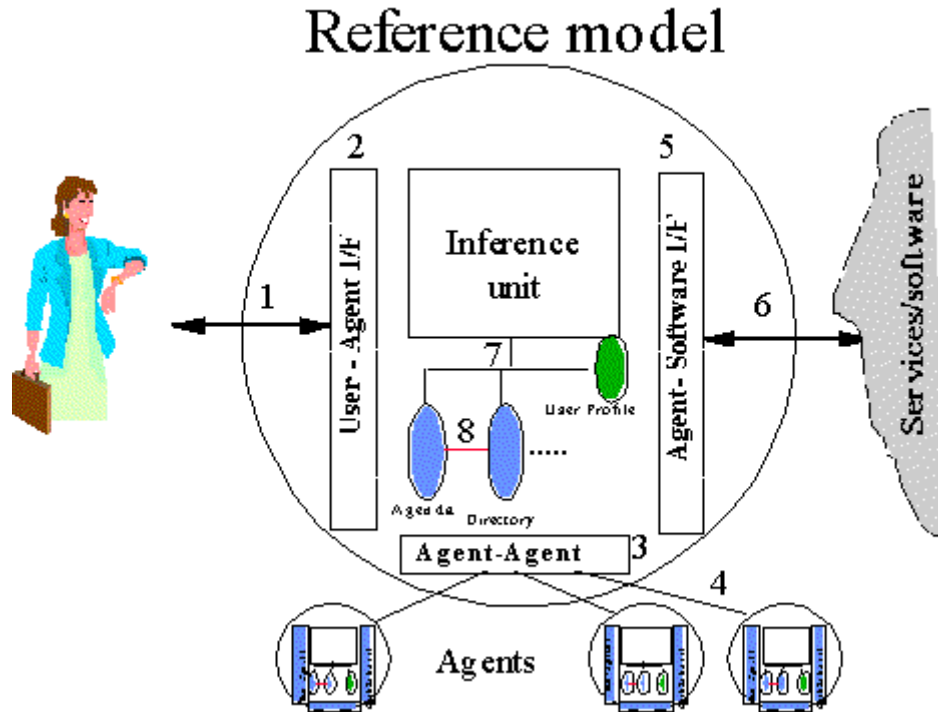

Figure 2 — Personal Assistant Reference Model

The reference model includes the following interfaces/protocols of interaction that are candidates for standardisation.

- 1) User-Agent Dialogue
- 2) Multi-Modal User-Agent Interface
- 3) Agent-Agent Communication Interface
- 4) Protocols for Agent-Agent Interaction
- 5) Agent-Software Interfaces
- 6) Agent-Software Communication Protocols
- 7) Agent-Functions Interfaces
- 8) Function Interoperability Interfaces/mechanisms

Multi-modality is the ultimate goal for human-agent interfaces. As a user interacts with a real personal assistant, he/she can speak face-to-face with the assistant or over the phone. Obviously, unconstrained natural language comprehension is also desirable. However, as first steps toward this general goal, "multi-modal" interaction is taken not as requirement for all agents to support all modalities, but merely that any single application should be able to select the one or more modalities required for the application. The composition of the personal assistant should be media-independent in order to allow for this choice, and otherwise provide the multi-modal conversions required such as converting text to speech in order to pass information over the phone.

In order to provide some concrete examples, the following scenarios serve to expose the basic PA's functions/services needed.

6.2.1 Directory Services

One of the basic functions of a PA is the management of the user's directory. This directory includes other people's/organisations' telephone numbers, addresses and personal and useful information about them. This information facilitates responses the PA may provide to user's needs in an intelligent way, based on the context of the request. For example, if the user asks to call an organisation and the PA by reference to the

285 opening and closing time notices that the call cannot be made, it will suggest alternative actions by inferring
 286 the user's possible intentions on the basis of the services provided by the organisation. A request for a call to
 287 a specific travel agency out of opening hours may result in the PA suggesting contacting a 24-hour call centre
 288 of an airline company.

289 **6.2.2 Meeting Scheduling Services**

290 The personal assistant includes, obviously, a calendar facility, that among other things can be used for
 291 scheduling of meetings, and negotiation with users and other agents. The functionality includes:

292 Identifying a mutually appropriate time for all participants to attend a meeting

293 Reserving an appropriate venue for the meeting

294 Organising associated facilities (e.g., lunch, OHP, etc.)

295 Issuing reminders to participants

296 Handling any problems which might arise at a later date

297 Cancelling meetings.

298 **6.2.3 Information Management Services**

299 This is a very large and nebulous set of tasks but also addresses one of the most critical needs for intelligent
 300 personal assistants. Most professionals are now inundated with too many sources of information, generally
 301 this is called "information overload". An agent can serve to semi-autonomously filter, sort, or otherwise
 302 respond to all these sources to help off-load some of the more mundane tasks these professionals now must
 303 do themselves. Such task include:

304 E-mail and news filtering (such as "junk" mail or news appends)

305 Sorting and prioritising all sorts of received information

306 Automatically responding or forwarding information to another user

307 A key aspect of such information management is not just filtering out the low priority information, but also
 308 providing the timely delivery of high priority items - anywhere, anytime, anyhow. Such delivery is dependent
 309 on the user's location, media/equipment limitations, and user preferences. For instance, an agent can be
 310 instructed to deliver important e-mail to an end-user even if the user only has a mobile phone by converting
 311 the text to speech. Of course, this same text-to-speech delivery of e-mail over a mobile phone can be applied
 312 to any text-based information source such as NNTP news, stock quotes, etc. Furthermore, given the cost of
 313 mobile phone connectivity, other technologies such as text summarisation can be employed, for most
 314 efficient delivery, to save the users time and cost. The provision of such summarisation and media to media
 315 transformation could be provided, for example, via external services.

316 Even under the most constrained situations, such as the user only having a pager, a personal assistant can at
 317 least notify the user about the existence and accessibility of an important new multimedia document. Even
 318 though the pager device cannot deliver the information, the personal assistant can notify the user of the
 319 appropriate equipment in the locality of the user that is available where the multimedia document
 320 could/would be sent to.

321 A less well-developed but equally important aspect of information management is the personal storage and
 322 retrieval of information. Even personal computer storage is becoming difficult to manage. Files are often
 323 duplicated, directory structures are haphazard, and the file systems themselves does not provide rich indexing
 324 and content search facilities. Here, a personal assistant can be asked to file and retrieve documents or even
 325 isolated bits of information, much like a personal secretary manages paper-based documents in the office.
 326 As an example of an external service which can be accessed by a PA, we briefly mention travel planning.

327 **6.2.4 Travel Planning Service**

328 A personal assistant can assist in planning the user's trip by interacting with the user, other agents and
 329 external directory services (such as yellow pages) and providing an appropriate plan of an intended trip and
 330 other guidance services. See the description of the FIPA'97 Personal Travel Assistance application for more
 331 details. In particular, the PA may assume much of the functionality of the Personal Travel Assistant agent.

332 **6.3 Personal Assistant FIPA'97 Application**

333 **6.3.1 Scenario**

334 The chosen scenario is that of arranging meetings among several participants, located across companies and
335 using different calendar management systems. This has been chosen for several reasons:

336 The scenario is instantly applicable to real-life

337 Current solutions are unwieldy and proprietary, making integration across networks and other services
338 difficult

339 The scenario can be easily extended to incorporate further services

340 This class of application has been widely studied, with many agent-based approaches (cf. [Kozieriook &
341 Maes, 1993])

342 The scenario lends itself well to agent technology, due to the need for

343 User profiling

344 Integration of heterogeneous software

345 Action on a user's behalf (semi-autonomy)

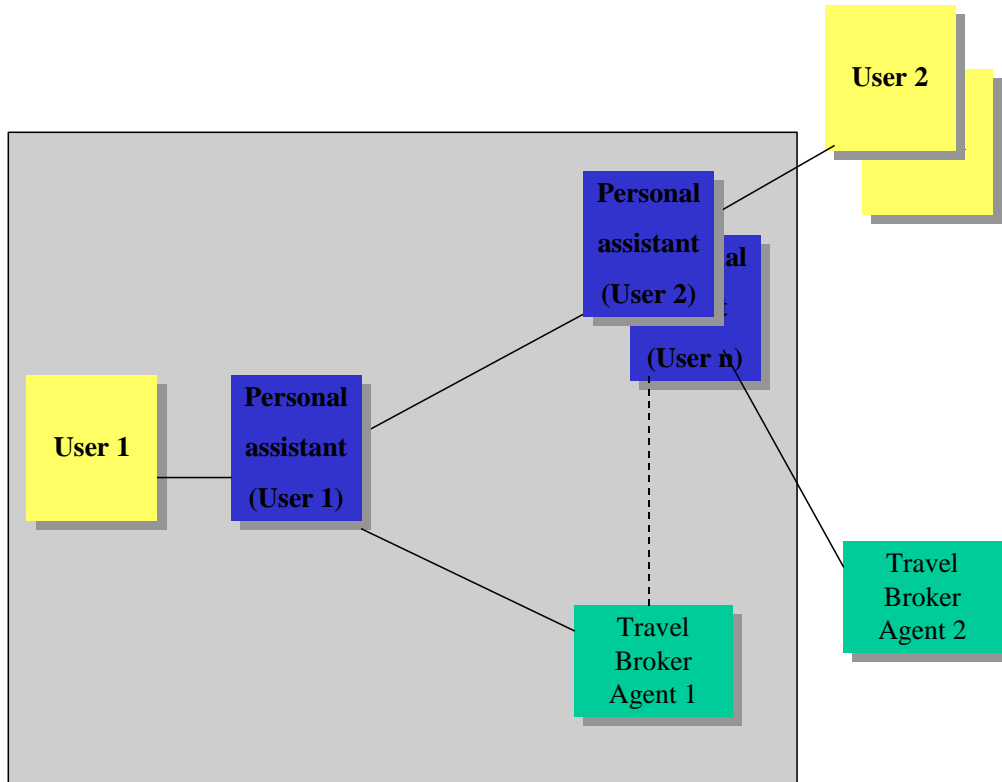

346 Local control (in particular, of the user's calendar)

347 The selected service is an integration of meeting scheduling and travel assistance. The user asks the agent to
348 set up a meeting with several participants. Because the meeting may involve travelling for some of the
349 participants, travel planning forms part of the meeting scheduling.

350 **6.3.2 System Architecture**

351 In this test application, the Personal Assistant provides a single unified interface to the user, and is
352 represented as a single agent, even though it may actually be composed of several agents.

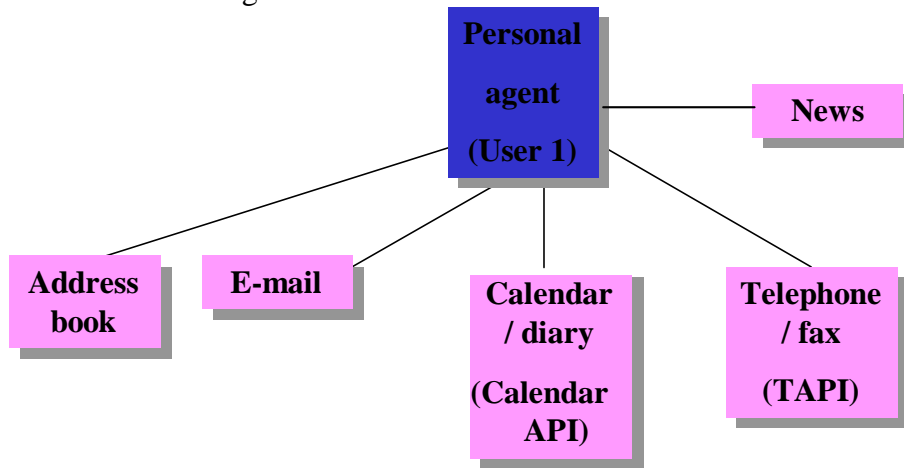

353 Each user is represented by a Personal Assistant. These PA's negotiate with each other to find an adequate
354 meeting place and time. They interact with Travel Broker Agents (TBAs) to find out about travel schedules
355 etc.

356

357 **Figure 3 — Agent Interactions in Personal Assistant Application Scenario**

358 The PA may make use of several existing programs to perform its tasks. A possible set of relevant software
359 for this test application is shown in Figure 3.

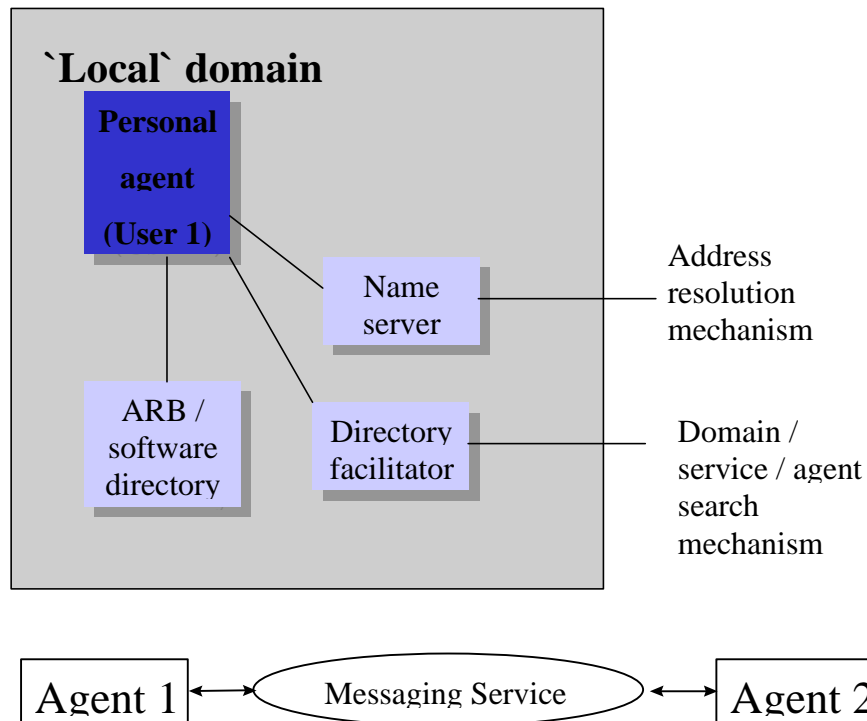

360

361 **Figure 4 — Integration of External Software**

362

362 The relationships between the PA and the Agent Management functions is shown in Figure 4.

363

364

365

366

367

368

369 **Figure 5 — Interaction with Agent Management Entities**

370

370 FIPA technical committee TC5 is defining a set of scenarios based on one particular aspect of the Personal
371 Assisant (PA) role, that of arranging appointments for activities, such as meetings, which involve a number
372 of participants. The PAs of the participants must cooperate to ensure that the meeting is arranged for a time
373 and place which is mutually acceptable to all their users. The PAs may also consult agents offering travel
374 broking services as defined by TC4.

375

375 Basic scenario: User 1 is chairman of a committee, and asks his PA to arrange a committee meeting.

376

376 Subscenario 1: User 1 suggests a specific time, duration and location for the meeting. The simplest case is

377

377 that all participants are required to attend the meeting.

378 Subscenario 2: User 1 suggests a range of possible times to start the meeting. The duration and location of the
379 meeting remain specific.

380 Subscenario 3: User 1 suggests a range of possible times to start the meeting as well as a set of locations at
381 which the meeting can take place.

382 In the scenarios, only those participants which have personal assistants will be considered in the agent-based
383 negotiation of the meeting. Other possible interfaces (directly between personal agent and another human)
384 will not be required.

385 It is up to the individual PA application to associate personal assistants with their users. I.e. if the initiator enters a list of
386 participants to the meeting, the initiator's agent needs to be able to communicate with the personal assistants of the participants.

387 The above subscenarios are in order of increasing sophistication and difficulty of implementation. Further
388 scenarios, which are not directly under consideration in this specification, could be achieved by allowing
389 negotiation about the duration and actual participants in the meeting.

390 A field trial prototype should demonstrate cooperative meeting arrangement involving several PAs. It should
391 implement at least the functionality required by the simplest subscenario, and preferably more. One or more
392 of the PAs should make use of travel planning services provided by a PTA field trial system. It is preferable
393 that interoperability of at least two independently-designed and implemented types of PA be demonstrated.

394 The agents in the system must communicate using an agent communication language compliant with the
395 FIPA specification. The messages must be delivered using an implementation of a FIPA message service.

396 The system must be supported by at least one Directory Facilitator (DF, yellow pages) and Agent Name
397 Server (ANS, white pages). However, it is preferable that more than one domain is involved and hence more
398 than one DF and ANS and that inter-domain address resolution, message routing and 'yellow pages' searching
399 be demonstrated.

400 Certainly further scenarios in the area of personal assistance may be defined and developed.

401 **6.4 FIPA technologies used**

402 Because the test application is primarily meant to provide an evaluation and validation of the normative parts
403 of the FIPA specification, it is here elaborated which parts of the specification are actually used within this
404 application.

405 **6.4.1 Agent Management**

406 This application makes use of the Directory Facilitator as specified in Part 1 and, as such, requires agents to
407 register with the DF according to the mandatory specification given in Part 1 Section 9.2.5 register-agent and
408 9.2.6 deregister-agent Furthermore, the following optional attributes are also to be used in the Personal
409 Assistant application:

410 search(Section 9.2.2)

411 The particular ontology used and specific representation of these attributes will be defined in the field trial.

412 **6.4.2 Agent Communication Language**

413 This application makes use of the ACL as specified in Part 2 and, as such, requires agents to communicate
414 with each other according to the ACL specification. In particular, the following communicative acts are used
415 in this application:

416 cfp, accept-proposal, reject-proposal,not-understood,propose,refuse,inform,failure,perform

417 Furthermore the FIPA-Contract-Net and FIPA-Request interaction protocols are used, thus, personal
418 assistants conforming to this specification must be capable of handling these protocols.

419 **6.4.2.1 Human-Agent Interaction (informative)**

420 Although the FIPA 97 specification does not specifically address the issues of Human-Agent Interaction, we
421 support the position that humans may be viewed as agents in their own right, and that their interaction
422 between software or physical agents may also be accomplished using ACL. Since humans do not speak ACL
423 directly, some sort of translation service from a user-friendly interface (e.g. graphical or speech-based) into
424 ACL is required (cf. Figure 6). This may be accomplished by supplying a special *User Interface Agent*. It is

425 recommended, but not necessary, that a particular PA implementation provide such an ACL-based interface
 426 to the user. In particular, experience gained from this approach will benefit future standardisation efforts in
 427 this area.

428
 429 **Figure 6 — Agent-Human Interaction via User Interface Agent**

430 6.4.2.2 Contents of Interactions

431 Thus, the following communicative acts between users and their personal assistants could be used:

- 432 a) U -> PA : give task to arrange meeting (including reporting requirements)
- 433 b) PA -> U: progress status of task, at least success or failure (with reasons)
- 434 c) U -> PA: permission to commit to meeting
- 435 d) PA->U: request for permission to commit
- 436 e) PA -> U: inform commitment made
- 437 f) U -> PA: degree of delegation authority

438 6.4.3 Agent / Software Integration

439 As a user's calendar is private to the user and his Personal Assistant, the software wrapping technology
 440 specified in Part 3 is not currently used in this application. However, a Personal Assistant may access the
 441 following existing software directly via the appropriate interfaces:

442 diary or calendar management system: requirements should be identified, they will probably be met by a
 443 Calendar API

444 address book: basic general-purpose database

445 e-mail / fax:

446 PA can send messages to another user who has no PA

447 PA might be able to interpret structured e-mail messages

448 TAPI (for communicating via telephone with the user)

449 6.4.4 Personal Travel Assistance

450 Participants in a meeting may be required to travel to the location of the meeting, in which case the PA may
 451 access a PTA system as specified in Part 4 to arrange a travel plan.

452 7 Detailed Specification

453 This section presents the detailed specification of the FIPA'97 Personal Assistant application scenario.

454 7.1 Informal Description of PA Content Language

455 The primary object in the PA Application is the action PA-Meet. This action is something a human
 456 participant in a meeting must carry out, and is thus, the primary subject of negotiation among the humans'
 457 Personal Assistants. As there is no standard ontology of actions or objects we must confine the specification
 458 to the minimal requirements of PA.

459 It is suggested that a PA implement the PA-Schedule action, which takes a meeting as its argument. A PA
 460 can be ordered to perform this action by the user via the user interface agent. The action in turn may triggers
 461 the FIPA-ContractNet interaction protocol, as applied to the special action PA-Participate, which,
 462 conceptually, is performed by the participants of the meeting.

463 It has been decided to adopt the vCalendar format is to be used for the representation of meeting objects. The
 464 resultant confirmed meetings which have been confirmed after negotiation among the personal assistants will
 465 be represented entirely conformant to Version 1.0 specification, in order to enable straight-forward

466 integration with systems using vCalendar. In particular, the following mandatory parameters of vCalendar are
 467 supported by the PA application as follows:

468 VERSION: 1.0

469 CATEGORIES: - implementation specific, can be

470 specified by human initiator,

471 X-FIPA-Test for meetings which are not actually supposed to occur (e.g. for testing and demo purposes)

472 given a default value (e.g. X-FIPA-Meeting) by the PA

473 DESCRIPTION: - implementation specific, can be

474 specified by human initiator,

475 given a default value (e.g. X-FIPA-Meeting) by the PA

476 SUMMARY: - implementation specific, can be

477 specified by human initiator,

478 given a default value (e.g. X-FIPA-Meeting) by the PA

479 PRIORITY: - implementation specific, can be

480 specified by human initiator,

481 given a default value (e.g. 0) by the PA

482 Also, the following optional parameters of vCalendar are required for the PA application:

483 ATTENDEE;ROLE=ORGANIZER:John Doe for human initiator who is attending

484 ATTENDEE:John Doe for other participants

485 SEQUENCE: initially 0, incremented upon confirmation

486 UID: - implementation specific, globally unique identifier

487 STATUS: CONFIRMED (when the meeting has been confirmed accept-proposal)

488

489 The following optional parameters of vCalendar are also optional for the PA application:

490 LOCATION: PTA-compliant location designator. If location is given, the PA must/may be able to schedule the required
 491 trip to the location.

492

493 The following extensions to vCalendar are required for PA:

494 X-FIPA-ORGANIZER: for human initiator (whether attending or not)

495

496 It is, however, necessary to slightly modify Version 1.0 of the vCalendar specification for representing
 497 meetings under ongoing negotiation. The modifications are as follows:

498 DTEND: - UTC (if specified by human initiator) *or* X-FIPA-UnderNegotiation (if meeting start/end times are to be
 499 negotiated)

500 DTSTART: - UTC (if specified by human initiator) *or* X-FIPA-UnderNegotiation (if meeting start/end times are to
 501 be negotiated)

502 STATUS: UNDER NEGOTIATION (in cfp) *or* CONFIRMED (in accept-proposal)

503

504 7.2 Concrete Syntax of PA Content Language

505 The primary requirement of the content language is the representation of meetings, trips and the actions of
 506 scheduling the meeting (as carried out by the initiator's PA) and the action of participating in the meeting (as
 507 carried out by the human participants). Due to its simplicity, standard s-expression syntax is chosen.

508 This section describes the concrete syntax of the content language for the PA application (TC5).

509 The syntax is expressed in standard EBNF format as summarised in [FIPA Document fipa7612.doc].

510 Expressions in the content language appear in the ACL message format syntax as value expressions of the

511 ":content" parameter in the ACL message syntax, specifically as in:

512 :content "(" PA-content-message Proposition ")" .

513

514 The concrete syntax below further specifies the non-terminals PA-content-message and Proposition .

```

515 PA-content-message = "(" PA-Action ")".
516 PA-Action = PA-Meet | PA-Travel | PA-Schedule .
517 PA-Meet = "(PA-Meet" ObjectId PA-Meeting Result Status Agent
518 StartTime Duration Deadline ")" .
519 PA-Travel = "(PA-Travel" ObjectId PA-Trip Status Agent StartTime
520 Duration Deadline ")" .
521 PA-Schedule = "(PA-Schedule" ObjectId PA-Object Result Status Agent
522 StartTime Duration Deadline ")" .
523 PA-Object = PA-Meeting | PA-Trip .
524 PA-Meeting = "(PA-Meeting" ObjectId Initiator vCalendarObject Protocol
525 ")" .
526 TimeInterval = Time | "[" Time "," Time "]" .
527 TimeIntervals = "[" TimeInterval + "]" .
528 TimeIntervalTest = "InTimeInterval(" ObjectId".DTSTART , " TimeIntervals ")
529 AND" ObjectId".DTEND = " ObjectId".DTSTART + "
530 Number .
531 ObjectId = String | ObjectId".String .
532 Protocol = ":protocol" String .
533 Proposition = "true" | "false" | TimeIntervalTest | ObjectId".LOCATION" |
534 "(" Proposition ")"
535 "(eq" Term Term ")" |
536 "(and" Proposition Proposition ")" |
537 "(or" Proposition Proposition ")" .
538 Term = NumericalExpression | Time | String.
539 Reason = Proposition .
540 NumericalExpression = Number | "(" NumericalExpression ")" |
541 "(+" NumericalExpression NumericalExpression ")" |
542 "(-" NumericalExpression NumericalExpression ")" |
543 "(*" NumericalExpression
544 NumericalExpression ")" |
545 "(/" NumericalExpression
546 NumericalExpression ")" .
547 vCalendarObject = ":vCalendarObject" CalendarItem .
548 CalendarItem = <Specification of vCalendar objects as in the vCalendar
549 1.0 specification by the IMC and as discussed in Section
550 7.1> .
551 AgentReference = <Universal Agent Locator as specified in FIPA 97
552 Specification Part 1> .
553 Time = <ISO8601-Time; UTC-Format e.g. 19971010T123000Z> .
554 String = <As specified in FIPA 97 Specification Part 2> .
555 Number = <As specified in FIPA 97 Specification Part 2> .

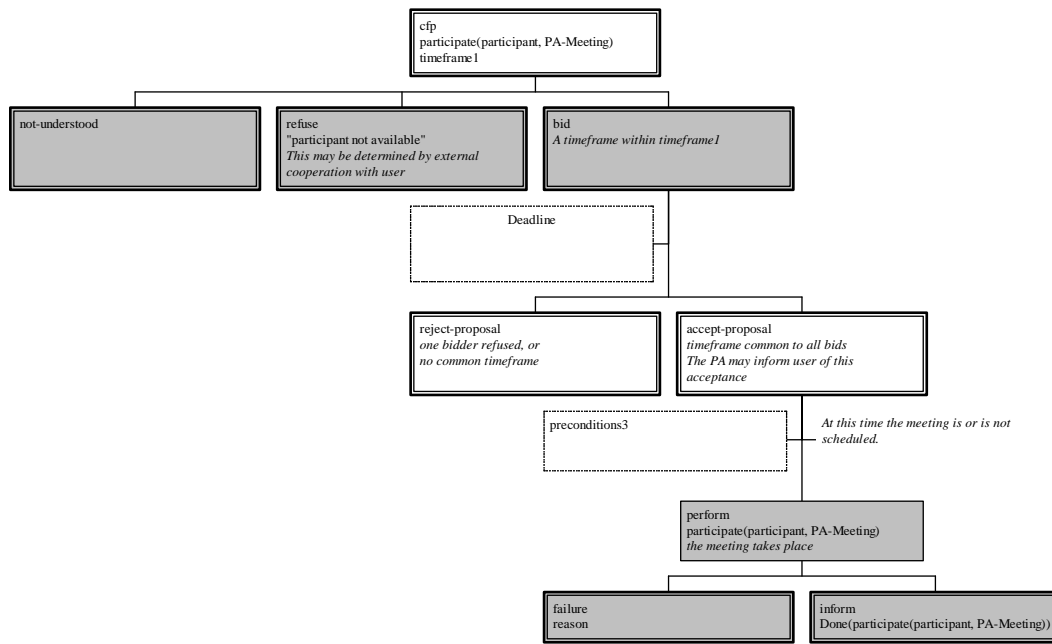

```

556 7.3 Interaction Protocols

557 The interaction protocols to be used for scheduling meetings are described in this section. On a normative
558 basis, are the protocols used between personal assistants to determine the times and locations of the meetings.
559 On an informative basis are the protocols which may be used between the users and their personal assistants
560 for triggering the meeting scheduling process and confirming the meeting.

561 7.3.1 Negotiating Meeting Details (normative)

562 The FIPA-ContractNet interaction protocol is used for negotiation of meetings (more accurately,
563 negotiation about the action of participating in the meetings) among the personal assistants. Whereas the
564 intent of the original contract net protocol [cf. Davis&Smith] is to select the best bid(s) of a set of submitted
565 bids, here the accept-proposal message is used only if all bids (i.e. time frames to attend the meeting) have a
566 time frame in common. This is the timeframe that is chosen. As the bids of a contract net imply firm
567 commitment, the PAs need to check with their users the initiator agent.

568

569

570

571

572

Figure 7 — FIPA-ContractNet (applied to meeting negotiation)

7.3.2 Scheduling a Meeting (informative)

If the interaction between the user and his/her PA is also modelled using ACL, an Order protocol can be used in order to initiate negotiation of a meeting:

573

574

575

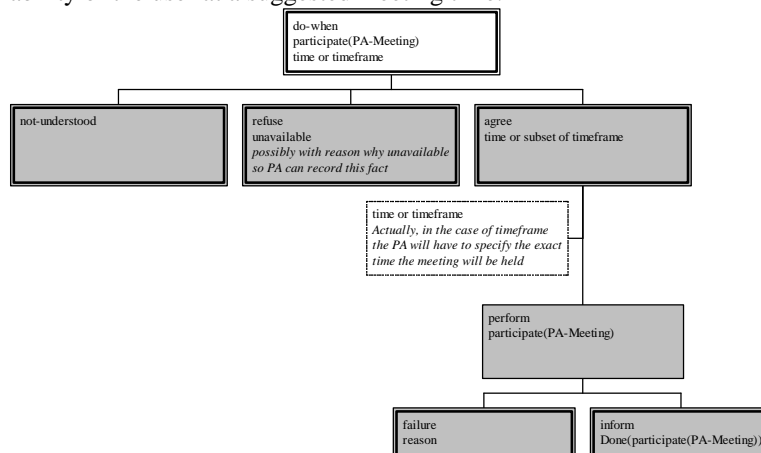

576

577

Figure 8 — PA-Order (applied to meeting scheduling)

7.3.3 Confirmation with User (informative)

If the interaction between the user and his/her PA is also modelled using ACL, the FIPA-RequestWhen protocol can be used by the PA to confirm the availability of the user at a suggested meeting time.

578

579

580

581 **8 Examples**

582 We give here a concrete example. Suppose John Doe wants to schedule an hour long meeting with some
 583 colleagues during some time on a given day. Then John Doe's personal assistant will send the following
 584 message to the personal agents of the desired participants:

```
585 (cfp
586   :sender UA-Donald
587   :receiver UA-Wiet
588   :content ((PA-Meet
589             :ObjectID WietMeet123
590             :Agent Hans Mustermann
591             :PA-Meeting (BEGIN:VCALENDAR
592   VERSION: 1.0
593   BEGIN:VEVENT
594   UID: 123
595   SUMMARY: FIPA Demo
596   ATTENDEE:Hans Mustermann
597   ATTENDEE;ROLE=ORGANIZER:John Doe
598   LOCATION:Siemens MchP 53.512
599   CATEGORIES: X-FIPA-Test
600   DESCRIPTION: This is just a test meeting. Please do
601     not attempt to attend it.
602   SEQUENCE: 0
603   PRIORITY: 0
604   DTSTART: X-FIPA-UnderNegotiation
605   DTEND: X-FIPA-UnderNegotiation
606   STATUS: UNDER NEGOTIATION
607   X-FIPA-ORGANIZER: John Doe
608   END:VEVENT
609   END:VCALENDAR
610   )
611   )
612   (InTimeIntervals(WietMeet123.PA-Meeting.DTSTART,[[1200,1800]])
613   DTEND = DTSTART + 60 )
614   )
615   :ontology FIPA-PA
616   :conversation-id UA-Donald345
617   :protocol FIPA-ContractNet
618   :reply-with Response123
619   :reply-by 101097T1300
620 )
```
